UNIVERSITY OF PETROLEUM AND ENERGY STUDIES, DEHRADUN

Recipe Sharing Application

Synopsis Report of the (Minor Project - II) in Semester V Prepared by:

S. No	Students Name	Roll Number	Sap Id
1.	Akshay Mohpal	R2142210078	500088177
2	Diya Khandelwal	R2142210293	500090939
3	Gaurav Bhandari	R2142210311	500090993
4	Kanishka Singh	R2142210393	500091377

BACHELORs OF TECHNOLOGY, COMPUTER SCIENCE ENGINEERING

With specialization in DevOps

Under the guidance of

Mr. Sandeep Pratap Singh

Division of Computer Science (SOCS), UPES

Bidholi Campus, Energy Acres, Dehradun – 248007

INDEX

Recipe Sharing App

Introduction
In a world driven by digital connectivity and a shared love of culinary delights, recipe-sharing apps have arisen as a game-changing tool for foodies to connect, create, and celebrate the art of cooking. As our kitchens become sanctuaries for experimentation and creativity, these applications offer a virtual platform for users to share their favorite recipes, discover new culinary trends, and develop a community centered on a shared love of fine food.

The user experience is an important part of recipe sharing applications. These platforms' overall success is attributed to its seamless navigation, visually appealing interfaces, and ability to seamlessly engage with other users.

This synopsis will delve into the project's core elements, exploring data representation, algorithmic implementation, real-time adaptability, and user interface design.

Background Information

In the ever-changing environment of culinary inquiry, recipe-sharing applications have become an essential component of the modern kitchen. These digital platforms, which aim to inspire creativity, community, and convenience, have a deep history founded in a love of food and a desire to share culinary experiences.

User experience is critical in recipe sharing apps. Intuitive navigation, visually appealing interfaces, and the capacity to quickly engage with other users are all important factors in the overall success of these platforms.

Motivation

The purpose is to provide useful insights into the world of recipe sharing applications, emphasizing its importance in establishing culinary communities, stimulating innovation, and altering how people experience and share their love of food.

Related work

The purpose is to provide useful insights into the world of recipe sharing applications, emphasizing its importance in cultivating culinary communities, stimulating innovation, and altering how people experience and share their love of food[2].

1. **Yummify**: It is a Recipe Sharing App built on the MERN stack that aims to ease the culinary experience for users globally. It has a large recipe collection, personalized user accounts, and a streamlined user interface. Yummify usage of React.js assures a responsive and entertaining frontend, while its strong backend, built with Node.js and Express.js, handles user authentication and recipe administration effectively.

2. **CulinaryConnect**: It is a Recipe Sharing App aimed at professional chefs and culinary aficionados. It is built with MongoDB, Express.js, React.js, and Node.js, and it allows chefs to display their skills and communicate with other users. The app's React.js frontend allows for smooth navigation, while the backend manages safe user login and recipe administration.

3. **FlavorNet**: It provides a new approach to Recipe Sharing by using machine-learning algorithms to provide personalized recipe recommendations. This MERN stack application uses MongoDB to efficiently store and retrieve data, and its React.js frontend provides users with a visually appealing and intuitive interface. FlavorNet promises to increase user engagement by providing intelligent recipe ideas based on personal tastes.

Problem Statement

Developing a robust and innovative recipe-sharing application that focuses on community building, user-friendly interfaces, seamless recipe sharing, enhanced social interactions, and user empowerment. The goal is to build a dynamic digital platform that not only acts as a repository for cooking creativity, but also fosters a vibrant global community of food enthusiasts by providing them with the tools and services they need to connect, share, and empower one another on their cooking adventures.

Objectives

1. **User Authentication with Passport.js:** Implement user registration and login using Passport.js authentication. Use JWTs (JSON Web Tokens) to secure authentication and manage user sessions. Ensure that Passport tactics are properly integrated (local strategy, social media logins) to create a flexible authentication system.

2. **Favorite List and User Profile**: Create a feature that allows users to add recipes to their favorites list. Provide the ability to view and manage their favorite recipes. Users can establish and customize their profiles, including photographs, bios, and posted recipes.

3. **Recipe Management and Search Functions:** Allow users to create, amend, and remove recipes using a sophisticated text editor. Implement a search function that allows users to look for recipes using keywords, ingredients, or categories. Include filters for selecting and categorizing recipes according to various parameters. Improve search performance by integrating a search engine such as Elastic search or using MongoDB's text search capabilities.

4. **Deployment with Amazon EKS:** Containerize your application with Docker to ensure consistency and portability. Configure Kubernetes for deploying and managing containers on Amazon EKS. Use EKS capabilities such as Auto Scaling to handle varying loads efficiently. Set up a CI/CD pipeline to automate the deployment process.

Problems and Challenges in the model:

*   **Community Engagement**- Difficulty in attracting and maintaining an active user base, hindering the creation of a thriving community.
    Challenge: Developing strategies to continuously engage users, encourage participation, and foster a sense of belonging within the community.

*   **User Interface Complexity**- Balancing user empowerment with a user-friendly interface might lead to potential complexities, especially for novice cooks.

Challenge: Designing an interface that is intuitive for both experienced and novice users, avoiding overwhelming features that could hinder usability.

- **Content Quality Control**- Ensuring the shared recipes meet quality standards and contribute positively to the community.
  Challenge: Implementing effective moderation tools and mechanisms to maintain content quality, while still allowing users to express their culinary creativity.

- **Technical Performance**- The application may face performance issues as the user base and content grow.
  Challenge: Optimizing the application's technical infrastructure to handle scalability, ensuring quick response times, and preventing downtime.

- **Privacy Concerns**- Users may be hesitant to share personal recipes or details due to privacy concerns.
  Challenge: Implementing robust privacy measures, transparent data handling policies, and ensuring user data security to build trust among users.

- **Continuous Improvement**- The model might struggle with adapting to evolving user needs and industry trends.
  Challenge: Establishing a system for collecting and analyzing user feedback, and consistently iterating on the application to introduce new features and improvements.

Example illustration

CookConnect is an innovative Recipe Sharing App that brings culinary lovers together to share, discover, and connect over their passion of cooking. Let us demonstrate the essential features and user interactions[1]:

1. Landing Page: CookConnect offers a visually appealing landing page with curated trending recipes. Prominent call-to-action buttons encourage new users to sign up and existing users to log in.
2. User Registration: New users can quickly register by providing basic details or using their social media accounts for a smooth sign-up experience. When users register, they receive a personalized welcome message.
3. User Profiles: Each user gets a personalized profile that includes their username, profile photo, and brief bio. Users can personalize their profiles by adding information like their cooking style, favorite cuisines, and dietary preferences.
4. Recipe Feed: The app's main feed displays user-submitted recipes with appealing visuals and concise explanations. Users can navigate through the feed to get a wide variety of recipes.
5. Recipe Details: Clicking on a recipe card opens the detailed view, which includes the whole recipe, ingredients, and systematic directions.
   Users can rate recipes, post comments, and save their favorite ones for later.
6. Recipe Creation: Share your own recipes by posting a new post. The recipe creation form includes fields for ingredients, preparation stages, cooking time, and any notes.
7. Social Interactions: CookConnect promotes community by allowing users to follow and connect with one another. Users are notified when new followers, likes, and comments appear on their recipes.
8. Search and Filters: Users may easily find certain recipes, cuisines, or ingredients with the app's robust search capability.
9. Personalized Recommendations: CookConnect uses a recommendation system to suggest recipes based on user preferences and previous interactions.

10. Personalized homepages show a combination of popular recipes and recommendations personalized to each user.
11. Responsive Design: CookConnect responsive design provides a smooth experience across all devices, including smartphones, tablets, and computers.
12. Continuous Improvement: The development team makes updates to answer customer input, solve errors, and introduce new features to improve the user experience.

Tech Stack

1. Frontend: React js
2. Backend: node js and express js
3. Data base: Mongodb
4. Version control: Git
5. Deployment: amazon Elastic kubernetes service
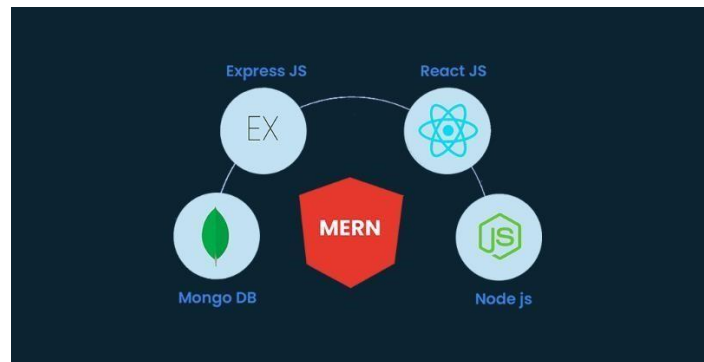

Proposed Method

Using the MERN (MongoDB, Express, React, and Node.js) stack to develop a recipe sharing app requires a methodical and planned approach. The development process's major steps are outlined in the suggested way below:

- **Describe the App's Needs**- Describe the Recipe Sharing App's features and functionalities in detail. Take into account user roles, essential features such as commenting, sharing, and recipe creation, user profiles, and any other elements that complement the objectives of your app.

- **MongoDB Design Database Schema**- Establish the data structure for users, comments, recipes, and other pertinent entities. Create connections between various entities to guarantee effective data retrieval.

- **Construct Backend Infrastructure Using Express & Node.js**- Installing npm and Node.js on development system. Create a new project in Node.js. Installing Express.js with npm to create a robust backend. Configure the backend's routes, middleware, and error management.

- **Put user authentication (passport, JWT) into practice**- For safe and stateless authentication, integrate user authentication using JWT (JSON Web Tokens). Use Passport.js to expedite user sessions and authentication procedures.

- **Provide an API for CRUD (CREDIT, Delete, and Update) operations on MongoDB recipes**- Create routes on recipes for CRUD activities. Use MongoDB queries to communicate with the database and retrieve recipe data.

- **Create React.js front-end views and components**- Create a brand-new front-end React.js project. Create and design React components for various views, including user profiles, the homepage, and recipe information. React Router can be used to switch between views.

- **Establish a Frontend-Backend API connection (Axios,**) - With Axios or Fetch, link the frontend React application to the back-end API to send HTTP queries. Assure smooth data submission and retrieval between the frontend and backend.

- **Put User Interface & Interaction into Practice (React Router, Components**) - Features like recipe likes, comments, and sharing can improve user involvement. Create a UI that is responsive and easy to use to guarantee a positive user experience.

- **Increase the number of features and improve user experience**- Add more features, like categories, search capabilities, and tailored user recommendations. Iteratively improve the user interface by considering user feedback.

- **Check the functionality of the app (debugging, unit testing**) - Test every component in the front end and back end thoroughly using unit tests. Fix and debug any problems found during the testing process.

- **Install in a hosting environment (such as AWS, Heroku, etc**.)- Select a hosting platform (such as AWS or Heroku) and configure the deployment. Install the frontend and backend in the hosting environment of your choice.

- **Constant Monitoring and Updates (Feature Updates, Bug Fixes) -** Put in place ongoing security and performance monitoring. Release updates often, fixing any faults and adding new features in response to user suggestions.

- **Open the app! -** Make the Recipe Sharing App available to users by launching it formally.

- **Development's End**- Celebrate your recipe-sharing app's successful development and release. For upcoming updates, keep an eye on user input and engagement.

Following this proposed method will help ensure a systematic and successful development process for your Recipe Sharing App using the MERN stack. Adjustments can be made based on specific project requirements and evolving user needs.

User

Login page

Have an account
— Yes → Sign in → Input user data → Home Page
— No → Sign up → Create Account → Input basic details → Home Page

Home Page → Share Tab → Enter the Complete Recipe → Camera/Gallery
- Yes (loop back)
- Post → No → scroll

Home Page → Search Tab → Enter Username, Dish → Select the desired from the recipe search result → Like, Comment, Bookmark → scroll

Home Page → Feed → Scroll the posts, Learn something new, Stay updated → Like, Comment, Bookmark

Home Page → View personal profile → Personal Profile → Log out of profile
- No (loop back to Personal Profile)
- Yes → Login page

Work has to be done:

- Project Planning- Defining clear project goals, milestones, and timelines. Establishing teams with roles and responsibilities.
- Market Research- Conduct thorough market research to understand existing recipe-sharing platforms, user preferences, and emerging trends.
- User Persona Development-Create detailed user personas to guide feature development and design decisions.
- Technical Architecture- Defining the technical architecture of the application, including the choice of frameworks, databases, and hosting solutions.
- UI/UX Design- Creating wireframes and mockups for the user interface. Prioritizing user-friendly design and intuitive navigation.
- Development- Begin the development phase, starting with the core features outlined in the objectives. Implementing backend functionalities for user authentication, recipe management, and social features.
- Testing- Conducting rigorous testing, including functionality testing, usability testing, and security testing.
- Feedback Iteration- Gathering feedbacks from a small user group and iterate on the application based on their input.
- Community Building- Launch the application with a focus on community building activities, such as virtual events, challenges, or forums.
- Monitoring and Optimization- Implement analytics tools to monitor user behavior and application performance. Continuously optimize the application based on user feedback and data analysis.
- Scalability Planning- Plan for scalability as the user base grows. Monitor server performance and scalability features.
- Documentation- Create comprehensive documentation for users and developers to ensure easy onboarding and troubleshooting.
- Continuous Improvement- Stay informed about industry trends and user preferences. Regularly release updates with new features and improvements based on user feedback.
